Issue # 102

Date 6/11/2010

Version PACP Import/Export V2.2, V4.2, V4.4

Issue

Software Vendor requiring the Total Length and Length Surveyed to be identical if the survey is completed before allowing the survey to import.

Requirement

PACP version 2.2, 4.2 and 4.4 do not require the Total Length and Length Surveyed to be identical. The Length Surveyed is the distance logged from the start of the survey at the pipe beginning to the end of the survey at the pipe end (PACP length). If the Total Length (map length) is known that should be entered at the start of the survey into the Total Length field. If the Total Length is not known and the survey is completed from manhole to manhole, the PACP length (recorded logged distance) can be used in the Total Length Field.

Conclusion

Any software vendor that is restricting the import of a pipe survey because the Total Length is different from the Surveyed Length for a completed (manhole to manhole) survey should issue a fix to their customer.
